

# Lab: Basic CRUD

This document defines the **lab assignments** for the [PostgreSQL course @ Software University](#).

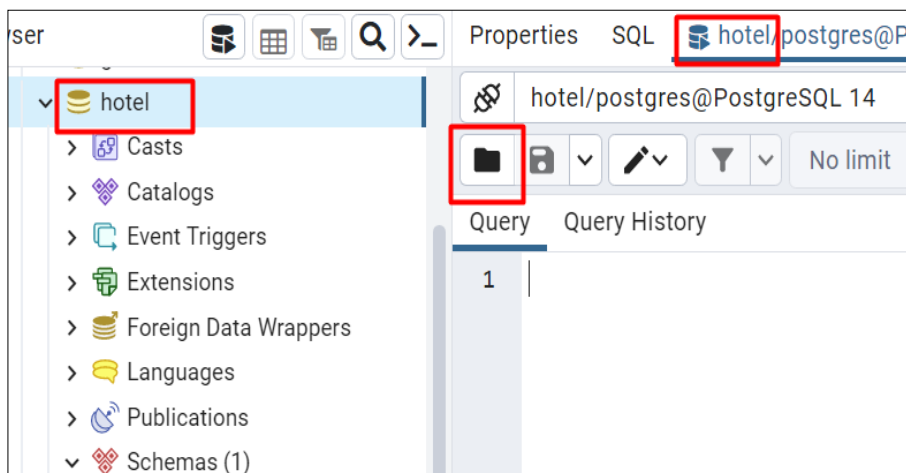

## Initial Steps:

Download the file **hotel\_db.sql** from your Resources section.

Create a database "**hotel**" and open its **Query Tool**. You can use either the **Query icon** or **Query Tool** from the drop-down menu. Make sure you have selected your database **hotel**.

Import the file by clicking on **Folder** icon.

Navigate to file **hotel\_db.sql** and select it. Queries will be loaded. Press the **Play** icon to execute them. This way you will create all tables and populate them with bulk data.

```

1
2 CREATE TABLE departments (
3     id serial PRIMARY KEY,
4     name VARCHAR(50)
5 );
6
7 INSERT INTO departments(name)
8 VALUES
9 ('Front Office'), ('Support'), ('Kitchen')
10
11 CREATE TABLE employees (
12     id serial PRIMARY KEY,

```

Get familiar with the **hotel** database and its **tables**. You will use them in the following exercises to make queries and retrieve data.

Exercises from the following section should be submitted to [Judge Contest](#) (tasks 1 to 7).

## 1. Select and Display Employee Information by Concatenating Columns

Write a query to select all employees and retrieve information about their **id**, **first\_name**, **last\_name** (as **Full Name**), and **job\_title** (as **Job Title**).

### Example

| id  | Full Name     | Job Title        |
|-----|---------------|------------------|
| 1   | John Smith    | Manager          |
| 2   | John Johnson  | Customer Service |
| 3   | Smith Johnson | Porter           |
| ... | ...           | ...              |

## 2. Select Employees by Filtering and Ordering

Write a query to select all employees (**id**, **first\_name** and **last\_name** (as **full\_name**), **job\_title**, **salary**) whose salaries are **higher than 1000.00**, **ordered by id**. Concatenate fields **first\_name** and **last\_name** into '**full\_name**'.

### Example

| id | full_name     | job_title        | salary |
|----|---------------|------------------|--------|
| 3  | Smith Johnson | Porter           | 1100   |
| 4  | Peter Petrov  | Front Desk Clerk | 1100   |

|     |              |       |         |
|-----|--------------|-------|---------|
| 5   | Peter Ivanov | Sales | 1500.23 |
| ... | ...          | ...   | ...     |

### 3. Select Employees by Multiple Filters

Write a query to retrieve information about employees, who are in **department 4** and have a salary **higher or equal to 1000**. Order the information by **id**.

#### Example

| id | first_name | last_name | job_title    | department_id | salary |
|----|------------|-----------|--------------|---------------|--------|
| 3  | Smith      | Johnson   | Porter       | 4             | 1100   |
| 9  | Nikolay    | Ivanov    | Housekeeping | 4             | 1600   |

### 4. Insert Data into Employees Table

Insert new records into table **employees** by writing a query. Select all employees' info to check the new entries.

**New values:**

**Samantha Young, Housekeeping, 4, 900**

**Roger Palmer, Waiter, 3, 928.33**

Submit **both INSERT and SELECT** queries.

#### Example

| id  | first_name | last_name | job_title    | department_id | salary |
|-----|------------|-----------|--------------|---------------|--------|
| ... | ...        | ...       | ...          | ...           | ...    |
| 10  | Samantha   | Young     | Housekeeping | 4             | 900    |
| 11  | Roger      | Palmer    | Waiter       | 3             | 928.33 |

### 5. Update Employees Salary

Update all employees' salaries whose **job\_title** is "Manager" by **adding 100**.

**Retrieve** information from table **employees** for all **managers**.

Submit **both UPDATE and SELECT** queries.

#### Example

| id | first_name | last_name | job_title | department_id | salary |
|----|------------|-----------|-----------|---------------|--------|
| 1  | John       | Smith     | Manager   | 1             | 1000   |

## 6. Delete from Table

Write a query to delete all employees from the **employees** table who are in department **2** or **1**. Then **select** all from table **employees** and order the information by **id**.

Submit **both DELETE** and **SELECT** queries.

### Example

| id | first_name | last_name | job_title      | department_id | salary |
|----|------------|-----------|----------------|---------------|--------|
| 3  | Smith      | Johnson   | Porter         | 4             | 1100   |
| 6  | Ivan       | Petrov    | Waiter         | 3             | 990    |
| 7  | Jack       | Jackson   | Executive Chef | 3             | 1800   |
| 9  | Nikolay    | Ivanov    | Housekeeping   | 4             | 1600   |

## 7. Create a View for Top Paid Employee

Write a query to create a **view** that selects all information about the top-paid employee from the **employees** table in the **hotel** database. Call your view to check the results.

Submit **both CREATE VIEW** and **SELECT** queries.

### Example

| id | first_name | last_name | job_title             | department_id | salary |
|----|------------|-----------|-----------------------|---------------|--------|
| 8  | Pedro      | Petrov    | Front Desk Supervisor | 1             | 2100   |
